The objective of this lab is to study CE (common emitter) BJT amplifier with emitter degeneration as well as CE amplifier including full bias circuit with AC coupled input and output. We will learn the concept of frequency response, mid band gain, and low and high frequency end points. Introduction. This lab will cover BJT CE amplifier with emitter degeneration shown in Fig. 5 1 and CE amplifier with full bias circuit and AC coupled input and output shown in Fig. 5 2.

The objective of this lab is to learn how to operate BJT as an amplifying device. Specifically, we will learn the following in this lab: The physical meaning of the low-frequency small-signal parameters of BJT and ways to measure them The three configurations of BJT amplifiers, i.e., common emitter (CE), common collector (CC),

BJT Common Emitter Amplifier with emitter degeneration. A basic BJT common emitter amplifier has a very high gain that may vary widely from one transistor to the next. The gain is a strong function of both temperature and bias current, and so the actual gain is somewhat unpredictable.

BJT circuits are used as small-signal amplifiers. The term small-signal refers to the use of signals that take up a relatively small percentage of an amplifier 's operational range. Additionally, you will learn how to reduce an amplifier to an equivalent dc and ac circuit for easier analysis, and you will learn about multistage amplifiers.

The BJT and MOS versions function as an inverting voltage amplifier and are shown in figure 9.2. The base or gate terminal of the transistor serves as the input, the collector or drain is the output, and the emitter or source is common to both input and output (it may be tied to the ground reference or the power supply rail), which gives rise to its common name.

As we know, a BJT requires a V_{BE} of approximately 0.7 V in order to operate in its forward active region. If we are designing the positive half-cycle section of a complementary push-pull Class B amplifier with a NPN BJT, we could connect the emitter to

ground and drive the base directly.

The transistor (BJT, FET) is a major component in an amplifier system. When a transistor is used as an amplifier, the first step is to choose an appropriate configuration, in which device is to be used. Then, the transistor should be biased to get the desired Q-point. The signal is applied to the amplifier input and output gain is achieved.

Beta is sometimes referred to as h_{FE} which is the transistors forward current gain in the common emitter configuration. Beta has no units as it is a fixed ratio of the two currents, I_c and I_b so a small change in the Base current will cause a large change in the Collector current. One final point about Beta. Transistors of the same type and part number will have large variations in their Beta ...
