Nonconventional and Vernacular Construction Materials: Characterisation, Properties and Applications, Second Edition covers the topic by taking into account sustainability, the conservation movement, and current interests in cultural identity and its preservation. This updated edition presents case studies, information on relevant codes and regulations, and how they apply (or do not apply) to nocmats. Leading international experts contribute chapters on current applications and the engineering of these construction materials. Sections review vernacular construction, provide future directions for nonconventional and vernacular materials research, focus on natural fibers, and cover the use of industrial byproducts and natural ashes in cement mortar and concrete. Takes a scientifically rigorous approach to vernacular and non-conventional building materials and their applications Includes a series of case studies and new material on codes and regulations, thus providing an invaluable compendium of practical knowhow Presents the wider context of materials science and its applications in the sustainability agenda

Earthen architecture constitutes one of the most diverse forms of cultural heritage and one of the most challenging to preserve. It dates from all periods and is found on all continents but is particularly prevalent in Africa, where it has been a building tradition for centuries. Sites range from ancestral cities in Mali to the palaces of Abomey in Benin, from monuments and mosques in Iran and Buddhist temples on the Silk Road to Spanish missions in California. This volume's sixty-four papers address such themes as earthen architecture in Mali, the conservation of living sites, local knowledge systems and intangible aspects, seismic and other natural forces, the conservation and management of archaeological sites, research advances, and training.

The second volume targets practitioners and focuses on the process of green architecture by combining concepts and technologies with best practices for each integral design component

This memorandum provides technical and economic information on alternative technologies for the production of stabilised soil blocks. The information provided relates mostly to small-scale units producing up to 400 blocks per day. It covers all aspects of block making: the quarrying and testing of raw materials; the choice of soil stabilisers; pre-processing operations (grinding, sieving, proportioning and mixing); block-forming methods, including a detailed description of machines currently available for making soil blocks; the curing and testing of produced blocks; and the use of mortars and.

The Earth Construction Handbook is unique in providing a survey of applications and construction techniques for a material which: is naturally available and easy to use with even low craft skills; absorbs and desorbs humidity faster, and to a higher extent, than any other; produces hardly any environmental waste; and balances indoor climate and moisture creating a healthy environment. It also includes physical data, and explains the material's beneficial qualities and how to maximize these. The information given can be practically applied by engineers, architects, builders, planners, craftsmen and laymen who wish to construct cost-effective buildings which provide a healthy, balanced indoor climate.
