In economics, a model is a theoretical construct representing economic processes by a set of variables and a set of logical and/or quantitative relationships between them. The economic model is a simplified, often mathematical, framework designed to illustrate complex processes. Frequently, economic models posit structural parameters. A model may have various exogenous variables, and those variables may change to create various responses by economic variables. Methodological uses of models inclu

[Economic model - Wikipedia](#)

Financial models are mathematical representations of a company, financial asset(s), or any other investment. Quantitative modeling techniques are applied in Microsoft Excel or other spreadsheets, and incorporate a wide variety of inputs on accounting data such as cash flows, financial data such as stock market performance, and relevant non-financial metrics such as risk factors.
