Frameworks. Frameworks are sets of design patterns, APIs, and runtime implementations intended to simplify the design and coding process for building new applications. Examples of frameworks are Struts, JATO, and JavaServer Faces, described in the subsequent sections. Framework designers factor out common functions from existing applications and implement them using appropriate design patterns.

As with all design patterns, it is just a pattern. Therefore, how you implement it is up to you, as long as you follow the general guidelines. A Bit of History. The State pattern, like most good patterns, is language-agnostic. I came close to figuring out this pattern a long time ago in a job far, far away, before there were pattern catalogs.

The most popular pattern, up until Java 6 is:

```
Connection conn = null; try { // initialize connection // use connection } catch { // handle exception } finally { if (conn != null) { try { conn.close(); } catch (Exception e) { /* handle close exception, quite usually ignore */ } } }
```

 With Java 7 this will become less cumbersome with its try-with-resource construct.
