Network Flows Theory Algorithms And Applications [EPUB]

In graph theory, a flow network is a directed graph where each edge has a capacity and each edge receives a flow. The amount of flow on an edge cannot exceed the capacity of the edge. Often in operations research, a directed graph is called a network, the vertices are called nodes and the edges are called arcs. A flow must satisfy the restriction that the amount of flow into a node equals the amount of flow out of it, unless it is a source, which has only outgoing flow, or sink, which has only i

Network Flows Theory Algorithms And Applications

Introduction The classical algorithms for solving linear network flow problems are primal cost improvement methods, including simplex methods, which iteratively improve the primal cost by moving flow around simple cycles, and dual ascent methods, which iteratively improve the dual cost by changing the prices of a subset of nodes by equal amounts.

In optimization theory, maximum flow problems involve finding a feasible flow through a flow network that obtains the maximum possible flow rate. The maximum flow problem can be seen as a special case of more complex network flow problems, such as the circulation problem.
