Organic Polymer Chemistry - An Introduction to the Organic ...

Organic polymers are macromolecules in which the primary backbone of the molecular chain is composed, at least partially, of carbon atoms. Polymer backbones consisting of carbon along with other atoms - such as oxygen, nitrogen, and others - are, interestingly, more common than polymers with only carbon comprising the backbone.

Polymers are long chain, giant organic molecules are assembled from many smaller molecules called monomers. Polymers consist of many repeating monomer units in long chains, sometimes with branching or cross-linking between the chains. A polymer is analogous to a necklace made from many small beads (monomers).
