Medication Endings

Flashcards | Quizlet

In medicine, specifically in end-of-life care, palliative sedation is the palliative practice of relieving distress in a terminally ill person in the last hours or days of a dying person's life, usually by means of a continuous intravenous or subcutaneous infusion of a sedative drug, or by means of a specialized catheter designed to provide comfortable and discreet administration of ongoing medications via the rectal route. As of 2013, approximately tens of millions of people a year

Palliative sedation - Wikipedia

Each stem has hyphens at one or both ends of its text to show that it is found at the beginning, end, or in the middle of a generic name. For example, the stem “-azepam ” would be found at the end of a generic name, corresponds to the definition “ Antianxiety agents (diazepam type) ”, and Lorazepam as an example drug.

End-of-life care is the term used to describe the support and medical care given during the time surrounding death. Such care does not happen only in the moments before breathing ceases and the heart stops beating. Older people often live with one or more chronic illnesses and need a lot of care for days, weeks, and even months before death.

In *Being Mortal*, bestselling author Atul Gawande tackles the hardest challenge of his profession: how medicine can not only improve life but also the process of its ending. Medicine has triumphed in modern times, transforming birth, injury, and infectious disease from harrowing to manageable. But in the inevitable condition of aging and death, the goals of medicine seem too frequently to run ...
