Abstract. Recently, Wireless Sensor Networks (WSNs) have attracted lot of attention due to their pervasive nature and their wide deployment in Internet of Things, Cyber Physical Systems, and other emerging areas. The limited energy associated with WSNs is a major bottleneck of WSN technologies.

~~Energy harvesting in wireless sensor networks: A ...~~

In a wireless sensor network, sensor nodes are energy constrained, so if all the sensors nodes transmit their sensed data directly to the base station then it consumes a lot of energy of sensor nodes and decreases the network lifetime. In order to maximize the lifetime of wireless sensor networks different architectures are used.

~~Types of Wireless Sensor Networks - [Research Based Guide]~~

A wireless sensor network contains a large number of tiny sensor nodes that are densely deployed either inside the phenomenon to be sensed or very close to it. Sensor nodes consist of sensing, data processing, and communicating components. The position of sensor nodes need not be engineered or predetermined.
